What the records support, and what is still missing

Sample summary of a WattSaid™ project dossier · Longhorn data center campus, Abilene, Texas · Starfind AI

A project dossier answers one question for one onsite-power project: *what do dated public records actually support, and which records are still missing?* It is written for people who have to rely on a project's power story: lenders, investors, offtakers, suppliers and their advisers.

This page shows the kind of answer a dossier gives, using facts from government records only. Evidence as of 10 November 2026; permit status re-observed on 19 November 2026.

Question	What dated records support	What is still missing
Is onsite generation authorized?	Two issued instruments cover 10 earlier turbines: a Texas standard permit registration and a federal operating permit. A separate permit for a proposed 39-turbine expansion was listed as pending when the regulator's listings were observed on 31 October 2026 and 2 November 2026, and still was when they were read again on 19 November 2026	The final expansion permit and its effective date
How large is the expansion on paper?	Draft permit conditions describe 39 units at 34.1 MW gross ISO each. The application first proposed 41 positions; later filings show 39. The two designs are alternatives and are never added	Installed units, a net figure, and any figure at a customer meter
Has anything run?	8 of the 10 earlier turbines have a completed single-unit emission test on file with the regulator, and one signed startup notice exists. Each test reading belongs to one unit on one day and the readings are not added	Test reports for the other two units; any test or startup record for the expansion
Is gas supply evidenced?	Pipeline permits and pipeline construction notices are on file with the state pipeline regulator. An issuer's SEC filings report gas deliveries and a new lateral in the Abilene area, without tying either to this project	Signed service schedules, an identified delivery point and custody-meter readings
Is power reaching a customer?	Nothing in the regulator's files speaks to this	A signed customer acceptance and interval data from a revenue meter

What a dossier never says. It does not state megawatts as available, because no record reviewed clears any figure as available capacity. It does not say gas was delivered, that a customer accepted power, or what net output is, unless the record that proves it has been retrieved and reviewed. A missing record is reported as unresolved. It is not treated as zero, and it is not treated as proof that nothing happened.

What the full dossier contains.

- A short-answer page, then project identity and the scopes that must be kept apart.
- Permits by version and status, each with the date it was observed.
- Capacity on four separate bases (design, permit, contract disclosure, test results) that are never added together.
- Fuel and delivery evidence, and what each document does not show.
- What was tested and what the tests cannot tell you.
- A gap register: every open item, with the record that would close it and who is likely to hold it.
- A source list giving the document date, retrieval date and exact page or row for every fact, with links to the government and SEC originals.

Each dossier is pinned to a dated evidence release, so every statement can be reproduced later.

Dossiers are prepared per project and quoted individually: starfindai.com. Not legal, engineering or investment advice. Starfind AI did not visit the site or measure anything; facts are as stated in the cited public records on the dates given.
